Operators

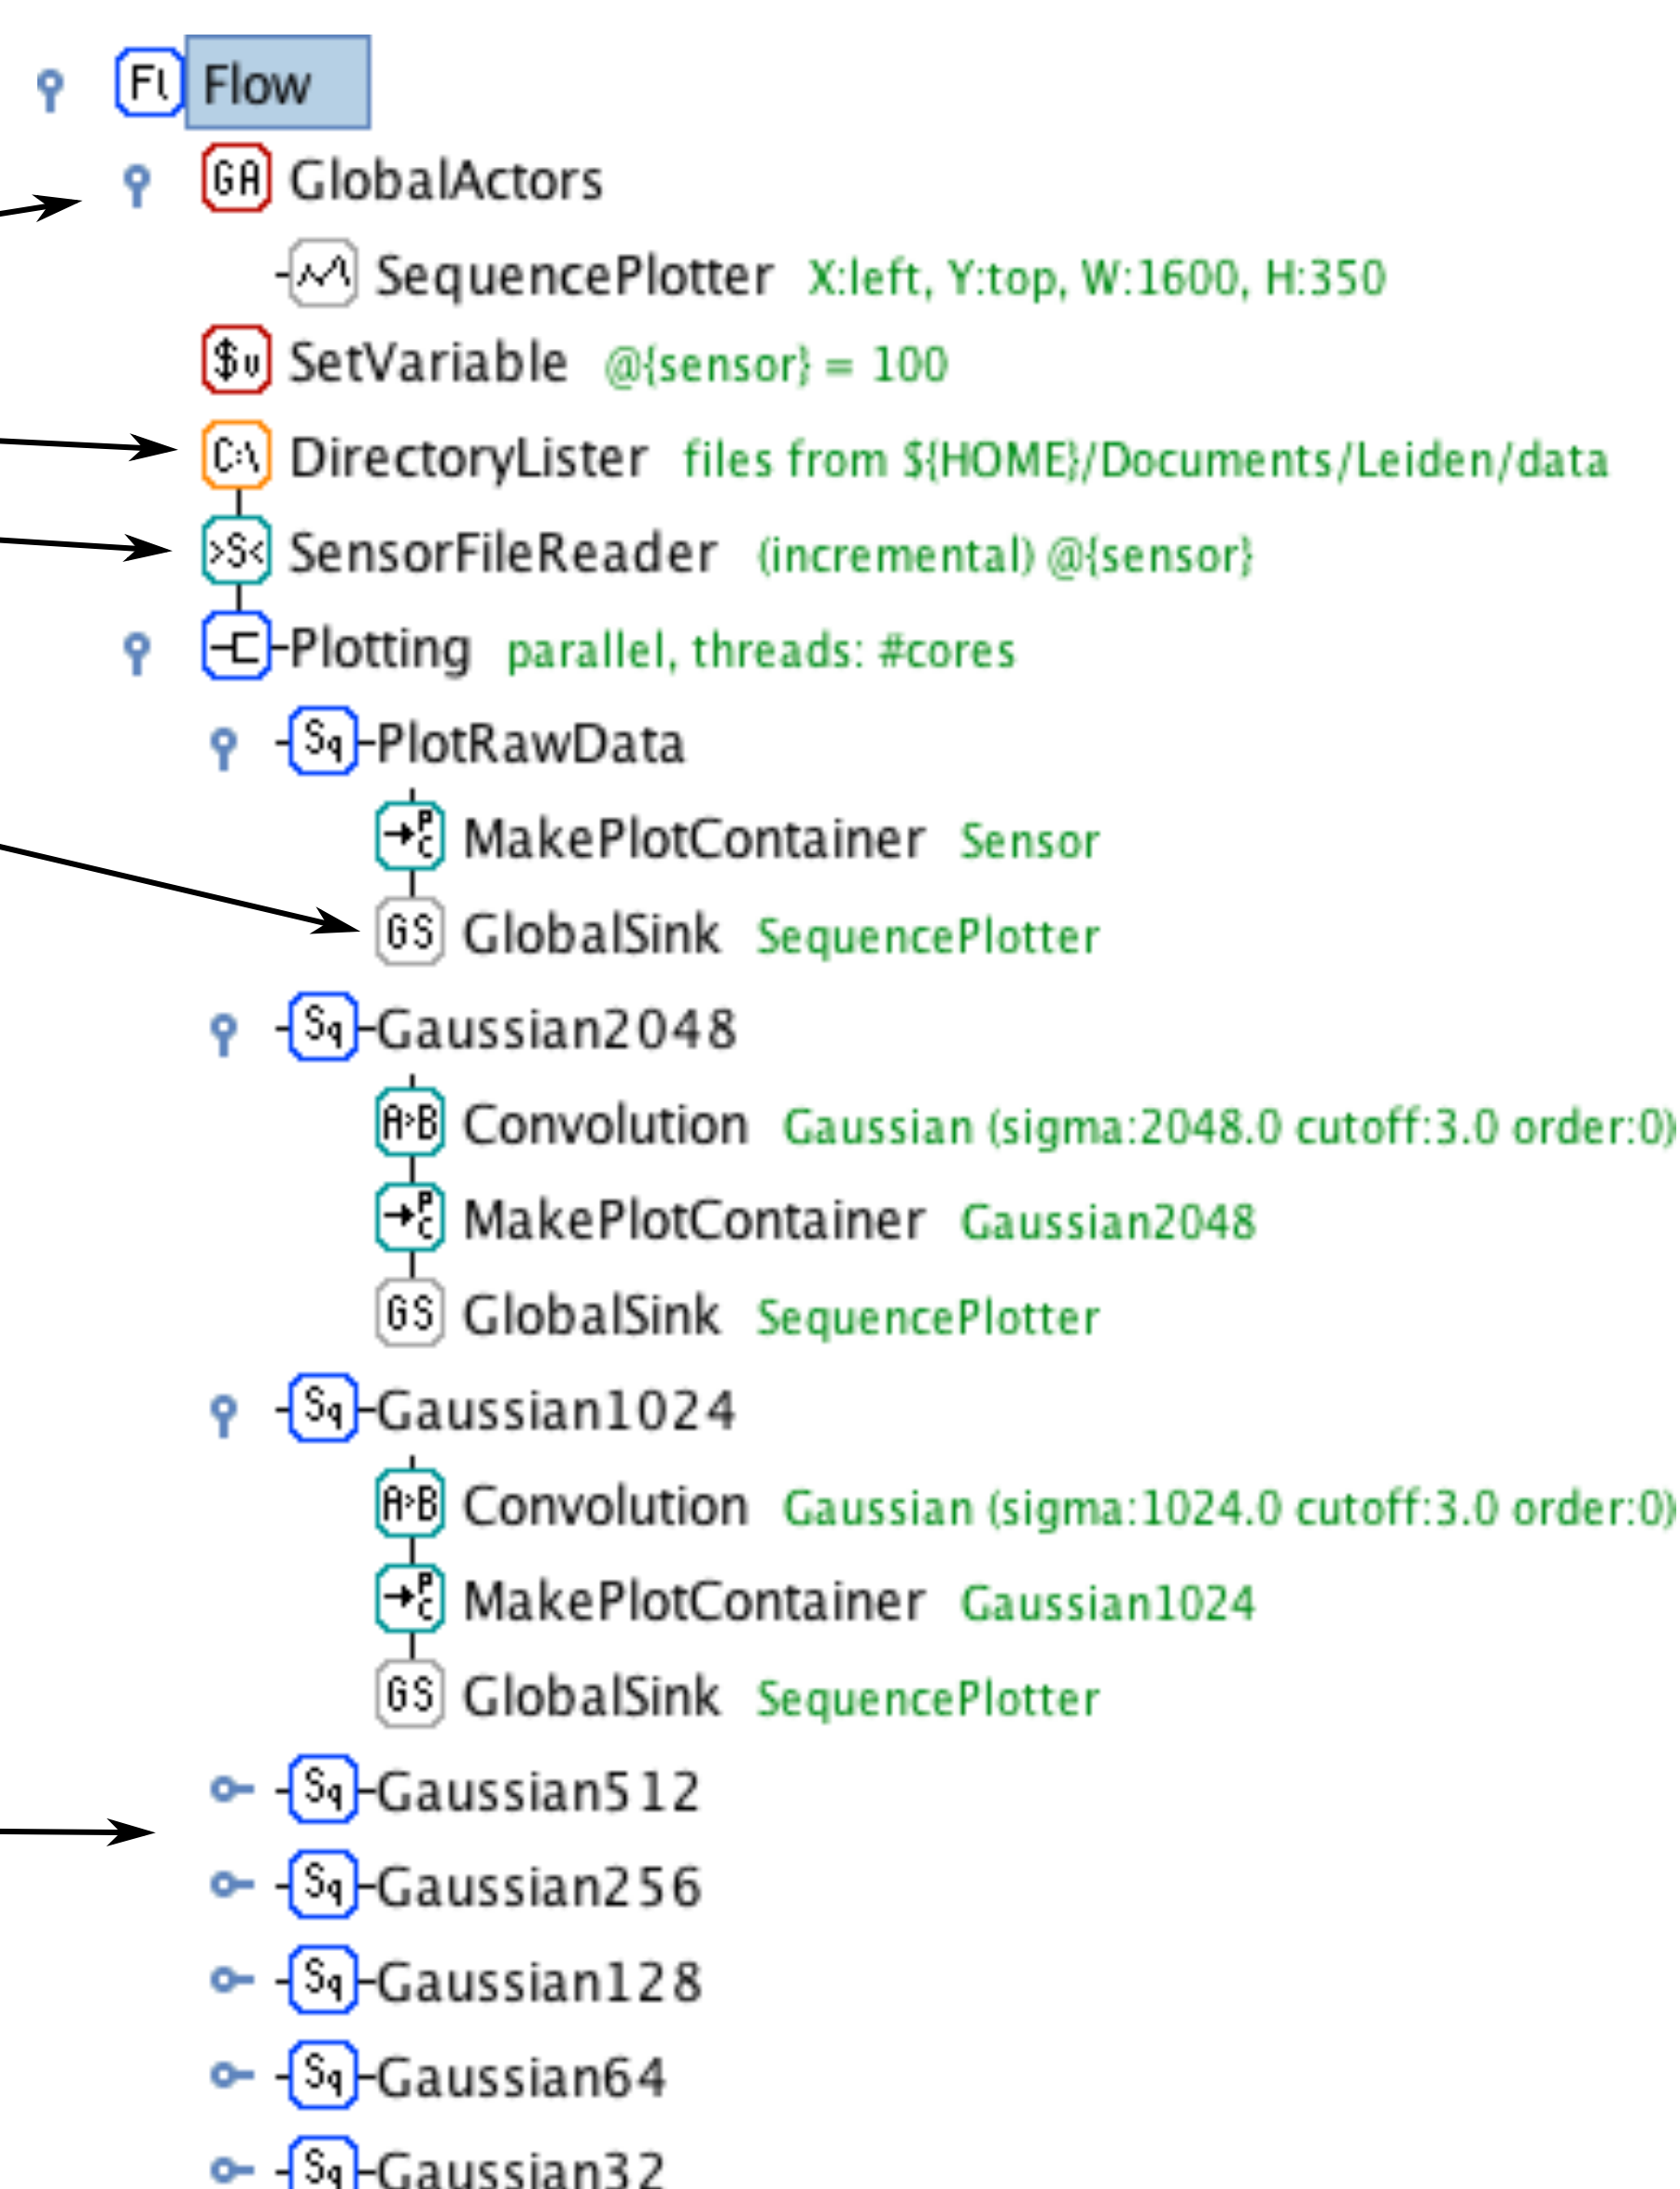

- **Standalone** (no input or output)
- **Source** (only output)
- **Transformer** (input and output)
- **Sink** (only input)

Tokens

Data is passed using tokens, wrapping single Java Object and Provenance information

Control actors

Determine how data flows, e.g., Sequence, Branch, Tee, Trigger, WhileLoop, If-Then-Else, Switch, ...

Tree structure

- very compact layout
- can view very large flows (by expanding only required sub-tree)
- no manual connecting of operators

N-to-M semantics

Tree cannot represent N-to-M, but can be mitigated by:

- variables
- key-value pairs
- global actors

Interactivity

Certain actors can interact with user, e.g., selecting file, prompting for making a selection
